This sequence has one or more of the biological properties of naturally occurring OB receptor protein. The OB receptor proteins and OB receptor/OB protein complexes are used for the treatment of obesity diabetes, high blood lipid levels and high cholesterol levels. The proteins may also be used to treat an individual for weight loss of weight maintenance required for purely cosmetic purposes.

The detection method can be used to diagnose infertility, or predisposition to infertility, while treatments that inhibit or down regulate the variants, gene cherapy to replace them in homozygotes or direct activation of downstream signal transduction can be used to improve fertility.

Also described is the use of labelled DNA probes based on the OB-R sequence to screen for other variants.

clibrary. The sequence shows near identity to a published OB-R sequence in the extracellular domain, with the exception of 3 amino acids, but there is extensive diversity in the intracellular cytoplasmic domain at the C-terminal end. A claimed method for Cytoplasmic domain at the C-terminal end. A claimed method for detection of OB-R in cells comprises extraction of: RNA and testing this for hybridisation to an oligonucleotide (I) derived from the COB-R variant gene, especially from the region beyond nucleotide administration of an agent that inhibits expression of the OB-R variant gene; and (2) identification of a compound that can supplement activity of leptin by: (I) incubating cells expressing OB-R variant first with leptin and then with a test compound, and (i) comparing activation signals between cells treated and not treated with the test compound. Inhibition/down-regulation of the variant OB-R (found in obese people) improves response of cells to weight regulation by leptin. Replacing variant OB-R by gene therapy (in homozygous individuals) can be used to treat obesity. Labelled probes based on the gene can be used to isolate other variant forms of the receptor gene or to detect the variant gene (e.g. for determining predisposition to obesity), while the OB-R gene can be used to express recombinant OB-R (optionally as fusion protein) and in standard hybridisation assays. The OB-R gene can also be used the rapeutically in cases of overexpression of functional OB-R (causing loss of appetite and hypermetabolic activity). Cells cartibodies that competitively inhibit, neutralise or enhance activity of the variant receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This polypept (OB-R). cc detection of a common precursor mRNA. A claimed method for this for hybridisation to an oligonucleotide (I) derived from the CC OB-R variant gene, especially from the region beyond nucleotide CZ 2770. Also claimed are methods of: (1) treating obesity by CC administration of an agent that inhibits expression of the OB-R CC variant gene; and (2) identification of a compound that can CC supplement activity of leptin by: (1) incubating cells expressing CC OB-R variant first with leptin and then with a test compound, and CC (ii) comparing activation signals between cells treated and not treated with the test compound. Inhibition/down-regulation of the CC variant OB-R (found in obese people) improves response of cells to comparing activation to be used to treat obesity. Labelled CC weight regulation by leptin. Replacing variant OB-R by gene therapy (in homozygous individuals) can be used to treat obesity. Labelled CC of the receptor gene or to detect the variant gene (e.g. for CC determining predisposition to obesity), while the OB-R gene can be used to express recombinant OB-R (optionally as fusion protein) and compended to express variant observes of functional OB-R (causing loss of appetite and hypermetabolic activity). Cells creen for (ant)agonists of leptin/OB-R interaction, also to generate CC antibodies that competitively inhibit, neutralise or enhance activity X
cytoplasmic domain at the C-terminal en-
splicing of a common precursor mRNA. A
detection of OB-R in cells comprises ex-
this for hybridisation to an oligonucle
OB-R variant gene, especially from the
2770. Also claimed are methods of: (1)
administration of an agent that inhibit,
variant gene; and (2) identification of
supplement activity of leptin by: (i) if
OB-R variant first with leptin and then
(ii) comparing activation signals between

Requence 11, Application US/08618957A

Patent No. 6355237

GENERAL INFORMATION:
APPLICANT: Snodgrass, H. Ralph
APPLICANT: Cioffi, Joseph
APPLICANT: Zupancic, Thomas Joel
APPLICANT: Shafer, Alan Wayne
TITLE OF INVENTION: METHODS FOR USING TH
TITLE OF INVENTION: GENE AND ITS GENE PR
TITLE OF INVENTION: DEVELOPMENT
NUMBER OF SEQUENCES: 28

CORRESPONDENCE ADDRESS:
ADDRESSEE: Pennie & Edmonds LLP
ADDRESSEE: Pennie & Edmonds LLP
STREET: 1155 AV
CITY: New York
STATE: NY
COUNTRY: USA
